GIBSON, RANDY W

ART UNIT

PAPER NUMBER

2841

DATE MAILED: 12/16/2005

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary	Application No.	Applicant(s)	
	10/689,213	SAXON ET AL.	
	Examiner	Art Unit	
	Randy W. Gibson	2841	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 11 October 2005.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-6,9-14 and 17-22 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-6, 9-14, 17-22 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 25 October 2005 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Response to Arguments

1. Applicant's arguments filed 11 October 2005 have been fully considered but they are not persuasive. Applicant made a conclusory statement that the reference to Hamilton does not disclose the claimed limitation of "determining a desired position for an axle ... at least from the portions ... cited by the examiner." The applicant did not perform any analysis of the sections of Hamilton relied upon by the examiner to explain this remark, so this argument is unpersuasive. To clarify the examiner's previous rejection, the examiner notes that the height of the trailer relative to the various axles is certainly regulated by Hamilton, and relative height is a "position", so the claim limitation is met. See *MPEP* § 2111.

Applicant also makes the argument that "[it] is not applicant's point that sliders are novel. Rather, the claimed invention properly positions the slider based upon determined information." First of all, this limitation does not seem to appear in all of the independent claims. Second of all, in the claims where this limitation does clearly appear, the examiner has made an obviousness rejection under section 103(a) of the statute, so "novelty" *per se* is not an issue.

Applicant is reminded that although the claims are interpreted in light of the specification, limitations from the specification are not read into the claims. See *In re Van Geuns*, 988 F.2d 1181, 26 USPQ2d 1057 (Fed. Cir. 1993). Also, in response to applicant's arguments against Hamilton individually, one cannot show nonobviousness by attacking references individually where the rejections are based on combinations of

references. See *In re Keller*, 642 F.2d 413, 208 USPQ 871 (CCPA 1981); *In re Merck & Co.*, 800 F.2d 1091, 231 USPQ 375 (Fed. Cir. 1986); and, **MPEP** § 2145.

Applicant did not address the other rejections, so these rejections must still be considered valid.

Claim Rejections - 35 USC § 102

2. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

3. Claims 2-6, 9-11, 21 and 22 are rejected under 35 U.S.C. 102(b) as being anticipated by Hamilton et al (U.S. # 4,651,838). Hamilton et al discloses the claimed invention including at least one load sensor (65), a memory unit (74) for storing load optimization data (Col. 8, lines 25-35), and a position sensor (120) for determining the position of an axle component of the vehicle for optimizing vehicle loading (Col. 8, lines 25-40, & Col. 12, lines 3-68), and calculating the center of gravity of the vehicle (Col. 8, lines 12-24). As for the limitation of the vehicle axle including a "slider", applicant has already admitted that these are known in the art (paragraph 0037).

Claim Rejections - 35 USC § 103

4. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

5. Claims 12-14, 19, and 20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Stevenson (U.S. # 5, 167,289) in view of Hamilton et al (U.S. # 4,651,838). As acknowledged by the applicant in his reply brief, the only difference between the apparatus disclosed by Stevenson and the claimed invention is the use of position sensors. However, Hamilton et al teach that it is preferable to use position sensors in connection with weight detecting pressure sensors to insure that the vehicle is level and that the air bag suspension is properly inflated before taking pressure readings (Col. 12, lines 3-68). It would have been obvious to the ordinary practitioner to modify the apparatus of Stevenson to include position sensors, as taught by Hamilton et al, to insure that the vehicle was in a condition to insure that accurate weight readings could be taken. As for the limitation of the vehicle axle including a "tandem slider", applicant has already admitted that these are known in the art (paragraph 0037). Note that Hamilton teaches calculating the center of gravity of the vehicle (Col. 8, lines 12-24) and would have been an obvious addition to Stevenson in order to warn the operator about potential vehicle instability.

6. Claims 12-14, 19, and 20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kyrtos (U.S. # 6,363,331 B1) in view of Hamilton et al (U.S. # 4,651,838). Kyrtos discloses an air suspension pressure weight sensor (Col. 2, lines 35-48), a memory unit for storing load optimization data (Col. 2, lines 49-57; Col. 3, lines 36-57). As acknowledged by the applicant in his reply brief, the only difference between apparatus disclosed by Kyrtos and the claimed invention is the use of position

sensors. However, Hamilton et al teach that it is preferable to use position sensors in connection with weight detecting pressure sensors to insure that the vehicle is level and that the air bag suspension is properly inflated before taking pressure readings (Col. 12, lines 3-68). It would have been obvious to the ordinary practitioner to modify the apparatus of Kyrtos to include position sensors, as taught by Hamilton et al, to insure that the vehicle was in a condition to insure that accurate weight readings could be taken. As for the limitation of the vehicle axle including a "tandem slider", applicant has already admitted that these are known in the art (paragraph 0037). Note that Hamilton teaches calculating the center of gravity of the vehicle (Col. 8, lines 12-24) and would have been an obvious addition to Kyrtos in order to warn the operator about potential vehicle instability.

7. Claims 1, 17 and 18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hamilton et al (U.S. # 4,651,838) in view of Wagner (U.S. # 4,854,407), Schmidt (U.S. 4,103,752), Breed et al (U.S. # 6,242,701 B1), and Schedrat et al (U.S. # 5,526,702). As discussed above, Hamilton et al discloses the claimed invention except for the position sensor for determining the position of the kingpin assembly. However, it is known in the art that movement of the kingpin assembly requires readjustment of the calibration of the pressure weight sensors since movement of the same shifts the weight being supported among the various axles of the vehicle as shown by the examples of Wagner (Abs.; Col. 3, lines 59-68) and Schmidt (Col. 6, lines 40-51). Wagner and

Schmidt both require manual readjustment, or recalibration, of the weight display device in response to the movement of the kingpin assembly. It is known in the art to use a linear variable resistor to automatically measure linear displacement of a rack assembly to allow automatic readjustment of a vehicle mounted weighing device as shown by the example of Breed et al (Col. 13, lines 22-61 and Col. 15, ln. 63 to col. 16, ln. 16). Since Schedrat et al suggest using position sensors in association with vehicle kingpin assemblies (Col. 2, lines 37-48), it would have been obvious to the ordinary practitioner to use a position sensor in connection with the kingpin assembly of Hamilton et al to allow the weight display device to automatically readjust for movement of the kingpin assembly without the operator having to remember to manually readjust the display device every time he moves the kingpin assembly.

8. Claims 1, 17 and 18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Stevenson (U.S. # 5,167,289) in view of Hamilton et al (U.S. # 4,651,838) as applied to claims 12-16 and 20 above, and further in view of Wagner (U.S. # 4,854,407), Schmidt (U.S. 4,103,752), Breed et al (U.S. # 6,242,701 B1), and Schedrat et al (U.S. # 5,526,702). As discussed above, the combination of Stevenson and Hamilton et al disclose the claimed invention except for the position sensor for determining the position of the kingpin assembly. However, it is known in the art that movement of the kingpin assembly requires readjustment of the calibration of the pressure weight sensors since movement of the same shifts the weight being supported among the various axles of the vehicle as shown by the examples of Wagner (Abs.; Col. 3, lines 59-68) and Schmidt

(Col. 6, lines 40-51). Wagner and Schmidt both require manual readjustment, or recalibration, of the weight display device in response to the movement of the kingpin assembly. It is known in the art to use a linear variable resistor to automatically measure linear displacement of a rack assembly to allow automatic readjustment of a vehicle mounted weighing device as shown by the example of Breed et al (Col. 13, lines 22-61 and Col. 15, ln. 63 to col. 16, ln. 16). Since Schedrat et al suggest using position sensors in association with vehicle kingpin assemblies (Col. 2, lines 37-48), it would have been obvious to the ordinary practitioner to use a position sensor in connection with the kingpin assembly of Stevenson to allow the weight display device to automatically readjust for movement of the kingpin assembly without the operator having to remember to manually readjust the display device every time he moves the kingpin assembly.

9. Claims 1, 17 and 18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kyrtos (U.S. # 6,363,331 B1) in view of Hamilton et al (U.S. # 4,651,838) as applied to claims 12-16 and 20 above, and further in view of Wagner (U.S. # 4,854,407), Schmidt (U.S. # 4,103,752), Breed et al (U.S. # 6,242,701 B1), and Schedrat et al (U.S. # 5,526,702). As discussed above, the combination of Kyrtos and Hamilton et al disclose the claimed invention except for the position sensor for determining the position of the kingpin assembly. However, it is known in the art that movement of the kingpin assembly requires readjustment of the calibration of the pressure weight sensors since movement of the same shifts the weight being supported among the various axles of the vehicle as shown by the examples of Wagner (Abs.; Col. 3, lines 59-68) and Schmidt

(Col. 6, lines 40-51). Wagner and Schmidt both require manual readjustment, or recalibration, of the weight display device in response to the movement of the kingpin assembly. It is known in the art to use a linear variable resistor to automatically measure linear displacement of a rack assembly to allow automatic readjustment of a vehicle mounted weighing device as shown by the example of Breed et al (Col. 13, lines 22-61 and Col. 15, ln. 63 to col. 16, ln. 16). Since Schedrat et al suggest using position sensors in association with vehicle kingpin assemblies (Col. 2, lines 37-48), it would have been obvious to the ordinary practioner to use a position sensor in connection with the kingpin assembly of Kyrtos to allow the weight display device to automatically readjust for movement of the kingpin assembly without the operator having to remember to manually readjust the display device every time he moves the kingpin assembly.

Conclusion

10. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

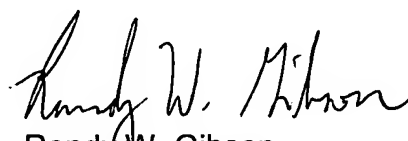

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any

extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Randy W. Gibson whose telephone number is (571) 272-2103. The examiner can normally be reached on Mon-Fri., 9-5.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kamand Cuneo can be reached on (571) 272-1957. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
